Question: Create and manipulate a `BOOK` table using SQL commands.

1. Create the following table:

```
BOOK(
    BOOK_ID NUMBER(5) PRIMARY KEY,
    TITLE VARCHAR2(50),
    AUTHOR VARCHAR2(30),
    PRICE NUMBER(6,2),
    CATEGORY VARCHAR2(20)
)
```

2. Insert **5 records** into the table.
3. Add a column `PUBLISHER VARCHAR2(40)` using the `ALTER` command.
4. Display all the records in the table.
5. Write SQL queries to display:
   (a) Books with price greater than 500.
   (b) Books with price between 300 and 800.
6. Display the books whose title starts with the letter `D`.
7. Display all books in descending order of price.
8. Find the following using aggregate functions:
   (a) Average price of books.
   (b) Minimum price.
9. Delete one book from the table.

Question: Create and manipulate an `EMPLOYEE` table using SQL commands.

1. Create the following table with appropriate constraints:

```
EMPLOYEE(
    EMP_ID NUMBER(5) PRIMARY KEY,
    EMP_NAME VARCHAR2(30) NOT NULL,
    EMAIL VARCHAR2(50) UNIQUE,
    SALARY NUMBER(8,2) CHECK(SALARY > 10000),
    CITY VARCHAR2(20) DEFAULT 'KOCHI'
)
```

2. Insert **5 employee records** into the table.
3. Display all employee records.
4. Write SQL queries to display:
   (a) Employees with salary greater than 30000.
   (b) Employees with salary between 20000 and 50000.
5. Display employees whose names start with the letter `A`.
6. Display employees in descending order of salary.
7. Find the following using aggregate functions:
   (a) Total salary.
   (b) Average salary.
8. Update the salary of one employee and delete another employee.
9. Attempt to insert a duplicate `EMP_ID` and observe the constraint violation.
